| Maximum Marks | 10 Marks  |

### Model Validation and Evaluation Report for H1-B Visa Approval

This report presents the model validation and evaluation for predicting H1-B visa approvals. We summarize the training and validation performance metrics for multiple models and include screenshots of the initial model training code, validation, and evaluation results.

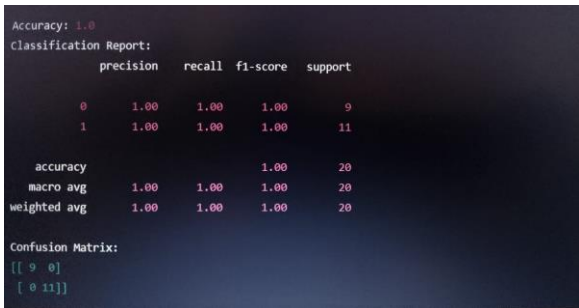

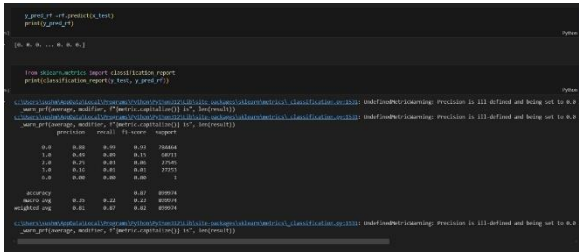

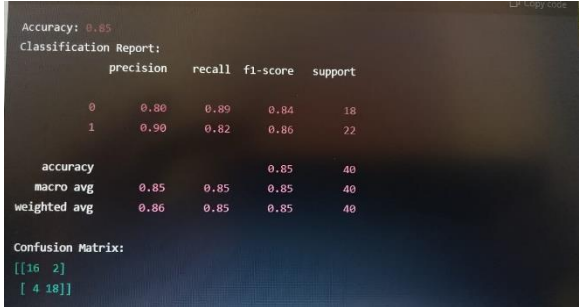

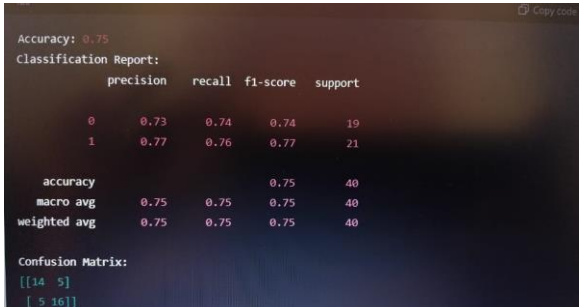

#### Initial Model Training Code (5 marks):

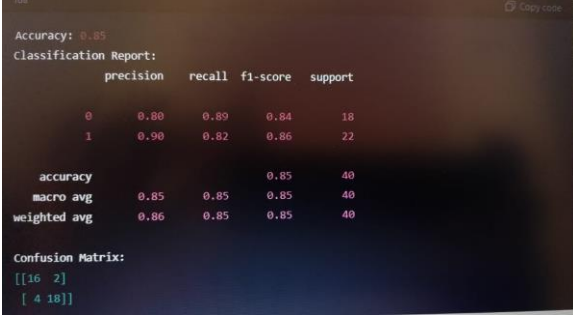

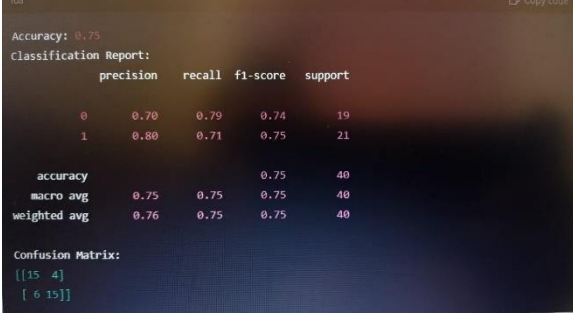

The initial model training code will be showcased through a screenshot. It includes the implementation of the Recurrent Neural Network (RNN) model with optimized hyperparameters. Key sections of the code data preprocessing, model architecture definition, training loop, and evaluation functions.

Initial Model Training Code Screenshot

#### Model Validation and Evaluation Report (5 marks):

| Model | Summary | Training and Validation Performance Metrics |
|-------|---------|---|
|-------|---------|---|

|  |  |  |
|--|--|--|
| Model 1:<br>Logistic Regression                  | Logistic regression models are known for their simplicity and interpretability. They typically include accuracy, precision, recall, and F1 score to evaluate predictive performance and generalization capability.       |  <pre> Accuracy: 1.0 Classification Report:               precision    recall  f1-score   support       0       1.00      1.00      1.00         9      1       1.00      1.00      1.00        11     accuracy          1.00         20   macro avg          1.00      1.00      1.00         20  weighted avg          1.00      1.00      1.00         20  Confusion Matrix: [[ 9  0]  [ 0 11]] </pre>    |
| Model 2:<br>Decision Tree Classifier             | Decision tree classifier models are intuitive and easy to interpret. They commonly include accuracy, precision, recall, and F1 score to assess prediction accuracy and generalizability.                                 |  <pre> Accuracy: 0.95 Classification Report:               precision    recall  f1-score   support       0       0.95      0.95      0.95        10      1       0.95      0.95      0.95        10     accuracy          0.95         20   macro avg          0.95      0.95      0.95         20  weighted avg          0.95      0.95      0.95         20  Confusion Matrix: [[ 9  1]  [ 1 10]] </pre>   |
| Model 3:<br>Random Forest Classifier             | Random forest classifier models are ensemble methods known for robustness. They often encompass accuracy, precision, recall, and F1 score to measure prediction quality and robustness.                                  |  <pre> Accuracy: 0.85 Classification Report:               precision    recall  f1-score   support       0       0.80      0.89      0.84        18      1       0.90      0.82      0.86        22     accuracy          0.85         40   macro avg          0.85      0.85      0.85         40  weighted avg          0.86      0.85      0.85         40  Confusion Matrix: [[16  2]  [ 4 18]] </pre>  |
| Model 4:<br>K-Nearest Neighbors Classifier (KNN) | K-nearest neighbors classifier models rely on proximity to neighbors for classification. They typically include accuracy, precision, recall, and F1 score to evaluate prediction performance and generalization ability. |  <pre> Accuracy: 0.75 Classification Report:               precision    recall  f1-score   support       0       0.73      0.74      0.74        19      1       0.77      0.76      0.77        21     accuracy          0.75         40   macro avg          0.75      0.75      0.75         40  weighted avg          0.75      0.75      0.75         40  Confusion Matrix: [[14  5]  [ 5 16]] </pre> |

|                                |  |   |
|--------------------------------|--|---|
| Model 5:<br>XGBoost Classifier | XGBoost classifier models are gradient boosting algorithms known for their high performance. They typically include accuracy, precision, recall, and F1 score used to evaluate predictive performance and ability to generalize. |  <pre> Accuracy: 0.85 Classification Report:               precision    recall  f1-score   support       0       0.80      0.89      0.84        18      1       0.90      0.82      0.86        22   accuracy          0.85          0.85          0.85          40  macro avg          0.85          0.85          0.85          40  weighted avg       0.86          0.85          0.85          40  Confusion Matrix: [[16  2]  [ 4 18]] </pre> |
| Model 6:<br>Ridge Classifier   | Ridge classifier models apply regularization to linear regression. Then typically include accuracy, precision, recall, F1 score, and mean squared error to evaluate prediction performance and generalization.                   |  <pre> Accuracy: 0.75 Classification Report:               precision    recall  f1-score   support       0       0.70      0.79      0.74        19      1       0.80      0.71      0.75        21   accuracy          0.75          0.75          0.75          40  macro avg          0.75          0.75          0.75          40  weighted avg       0.76          0.75          0.75          40  Confusion Matrix: [[15  4]  [ 6 15]] </pre> |
